## Question 7: Short Answer

(a) For a correct answer:

Accept one of the following:

- The student's drawing shows an incorrect ratio of $\mathrm{Sr}^{2+}$ and $\mathrm{OH}^{-}$ions.
- The student's drawing is not charge-balanced.
(b) (i) For the correct calculated value: $\mathbf{1}$ point
$\frac{0.043 \mathrm{~mol} \mathrm{Sr}^{2+}}{1 \mathrm{~L}} \times \frac{2 \mathrm{~mol} \mathrm{OH}^{-}}{1 \mathrm{~mol} \mathrm{Sr}^{2+}}=0.086 \mathrm{M} \mathrm{OH}^{-}$
(ii) For the correct calculated value, consistent with (b)(i):

1 point
$K_{s p}=\left[\mathrm{Sr}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}=(0.043)(0.086)^{2}=3.2 \times 10^{-4}$

|  | Total for part (b) | $\mathbf{2}$ points |
| :--- | ---: | ---: |
| (c) For the correct answer and a valid justification: | $\mathbf{1}$ point |  |

Less than. Because the $\operatorname{Sr}\left(\mathrm{NO}_{3}\right)_{2}(a q)$ solution already contains a common ion, $\mathrm{Sr}^{2+}(a q)$, the solubility of $\mathrm{Sr}(\mathrm{OH})_{2}$ will be decreased, resulting in a lower value of $\left[\mathrm{OH}^{-}\right]$.

Total for question $7 \quad 4$ points

Question 7

Begin your response to QUESTION 7 on this page.
7. Strontium hydroxide dissolves in water according to the following equation. The $K_{s p}$ expression for strontium hydroxide is provided.

$$
\mathrm{Sr}(\mathrm{OH})_{2}(s) \rightleftarrows \mathrm{Sr}^{2+}(a q)+2 \mathrm{OH}^{-}(a q) \quad K_{s p}=\left[\mathrm{Sr}^{2+}\right]\left[\mathrm{OH}^{-}\right]^{2}
$$

$$
\begin{aligned}
& =\mathrm{Sr}^{2+} \\
0 & =\mathrm{OH}^{-}
\end{aligned}
$$

(a) A student draws the particulate diagram shown to represent the ions present in an aqueous solution of $\mathrm{Sr}(\mathrm{OH})_{2}$. (Water molecules are intentionally omitted.) Identify the error in the student's drawing.
There should be double the amant of $\mathrm{OH}^{-}$molecules since its stoichiometric coefficient in the reaction is 2 . In the student's drawing there are equal numbers of particles of $\mathrm{Sr}^{2 t}$ and OH , which is incorrect.
(b) The student prepares a saturated solution by adding excess $\mathrm{Sr}(\mathrm{OH})_{2}(s)$ to distilled water and stirring until no more solid dissolves. The student then determines that $\left[\mathrm{Sr}^{2+}\right]=0.043 \mathrm{M}$ in the solution.
(i) Calculate the value of $\left[\mathrm{OH}^{-}\right]$in the solution.

$$
\begin{aligned}
& \operatorname{Sr}(\mathrm{OH})_{2} \underset{\mathrm{O}}{\stackrel{\mathrm{Sr}^{2+}}{2+}+\underset{\mathrm{O}}{2-} \quad\left[\mathrm{HH}^{-}\right]=2(0.043)} \\
& \frac{1}{c} \\
& \text { E } \\
& \begin{array}{ll}
+x & +2 x \\
0.043 & 0.086
\end{array} \quad\left[\mathrm{OH}^{-}\right]=0.086 \mathrm{M}
\end{aligned}
$$

(ii) Calculate the value of $K_{s p}$ for $\mathrm{Sr}(\mathrm{OH})_{2}$.

$$
\begin{array}{ll}
k_{s p}=\left[s_{r^{2}}\right]\left[\mathrm{OH}^{-}\right]^{2} & k_{\mathrm{sp}}=[0.043][0.086]^{2} \\
& k_{s p}=3.2 \times 10^{-4}
\end{array}
$$

## Question 7

## Continue your response to QUESTION 7 on this page.

(c) The student prepares a second saturated solution of $\mathrm{Sr}(\mathrm{OH})_{2}$ in aqueous $0.10 \mathrm{M} \mathrm{Sr}\left(\mathrm{NO}_{3}\right)_{2}$ instead of water. Will the value of $\left[\mathrm{OH}^{-}\right]$in the second solution be greater than, less than, or equal to the value in the first solution? Justify your answer. (Assume constant temperature.)
The salve of $\left[\mathrm{OH}^{-}\right]$will be lower because of the 70 common ton effect. Since $\operatorname{Sr}\left(\mathrm{NO}_{3}\right)_{2}$ is added to the solution, less $\mathrm{Sr}(\mathrm{OH})_{2}$ is able to dissolve before the solution is satiated so the concentration of $\mathrm{orl}^{-1}$ in solution is lower.

## Question 7

Note: Student samples are quoted verbatim and may contain spelling and grammatical errors.

## Overview

Question 7 presented students with a set of questions surrounding the solubility equilibrium for strontium hydroxide.

Part (a) required students to interpret a particulate-level diagram that illustrates a dissociation of $\mathrm{Sr}(\mathrm{OH})_{2}$ into its ions. Students were expected to make a claim about how the ratio of $\mathrm{Sr}^{2+}$ and OH - in the diagram is incorrectly illustrated (Learning Objective SPQ-3.B, Skill 6.A from the AP Chemistry Course and Exam Description).

Part (b)(i) required students to calculate [ $\mathrm{OH}^{-}$] using information given about $\left[\mathrm{Sr}^{2+}\right]$ using the stoichiometric relationship. Identifying that the relationship between $[\mathrm{OH}]$ ] and $\left[\mathrm{Sr}^{2+}\right]$ is $2: 1$, students must calculate a value of [OH-] that is double that of $\left[\mathrm{Sr}^{2+}\right](\mathrm{SPQ}-4 . \mathrm{A}, 5 . \mathrm{F})$.

Using the information provided in part (b)(i) and the calculated value of [OH-], part (b)(ii) prompted students to calculate the $K_{s p}$ value for the insoluble hydroxide using the provided $K_{s p}$ expression (SPQ-5.A, 5.F).

In part (c) the students were prompted with a second saturated solution of $\mathrm{Sr}(\mathrm{OH})_{2}$ that is prepared in $\mathrm{Sr}\left(\mathrm{NO}_{3}\right)_{2}(a q)$, rather than pure water. Students must assess whether the value of [OH-] in the second solution is greater than, less than, or the same as the value of [ $\mathrm{OH}^{-}$] in the first solution. Students must consider the impact on the equilibrium conditions if the $\mathrm{Sr}(\mathrm{OH})_{2}$ was to be added to a solution already containing $\mathrm{Sr}^{2+}(a q)$ ions, as compared to the original solution where $\mathrm{Sr}(\mathrm{OH})_{2}$ was added to pure water (SPQ-5.B, 2.F).

## Sample: 7A

## Score: 4

The point was earned in part (a) for indicating that the $\mathrm{OH}^{-}$to $\mathrm{Sr}^{2+}$ ratio should be 2:1, but in the drawing there are equal numbers of both types of ions. The point was earned in part (b)(i) for a correct calculation of $\left[\mathrm{OH}^{-}\right]$. In this example $\left[\mathrm{OH}^{-}\right]$is shown to be twice $\left[\mathrm{Sr}^{2+}\right]$. The point was earned in part (b)(ii) for a correct calculation of $K_{s p}$. In this example the $K_{s p}$ expression and the expression with the substituted concentrations show the work for this calculation. The point in part (c) was earned for stating that $\left[\mathrm{OH}^{-}\right]$is lower and providing a valid justification.

## Sample: 7B

## Score: 3

The point in part (a) was earned for indicating that the $\mathrm{OH}^{-}$to $\mathrm{Sr}^{2+}$ ratio should be $2: 1$, but in the drawing the ratio is $1: 1$. In this example the statement is made that $\left[\mathrm{OH}^{-}\right]$should be double $\left[\mathrm{Sr}^{2+}\right]$ and that what is drawn are equal amounts of $\mathrm{OH}^{-}$and $\mathrm{Sr}^{2+}$. The point in part (b)(i) was earned for correctly calculating $\left[\mathrm{OH}^{-}\right]$. The point in part (b)(ii) was earned for correctly calculating the $K_{\text {sp. }}$. The

## Question 7 (continued)

point in part (c) was not earned for stating that [ $\mathrm{OH}^{-}$] does not change. The response indicates that the reverse rate increases, but the final concentration of $\mathrm{OH}^{-}$is based on equilibrium, not on the rate at which equilibrium is attained.

## Sample: 7C

## Score: 1

The point in part (a) was earned for indicating that the correct ratio of $\mathrm{OH}^{-}$to $\mathrm{Sr}^{2+}$ is 2:1. The point in part (b)(i) was not earned for stating that $\left[\mathrm{OH}^{-}\right]$equals $\left[\mathrm{Sr}^{2+}\right]$. The value of $\left[\mathrm{OH}^{-}\right]$should be twice the value of $\left[\mathrm{Sr}^{2+}\right]$. The point in part (b)(ii) was not earned because the mathematical expression used to calculate the $K_{s p}$ is incorrect. The setup shown has the 0.043 squared but NOT the 2 outside the parentheses. This results in an incorrect calculation. The point in part (c) was not earned because the explanation of the decreased $\left[\mathrm{OH}^{-}\right]$is not associated with the increased $\left[\mathrm{Sr}^{2+}\right]$. The example attempts to justify using hydrogen ions, but it is the increase in $\left[\mathrm{Sr}^{2+}\right]$ that causes the decrease in $\left[\mathrm{OH}^{-}\right]$.
