Applying the Scoring Criteria

Apply the question scoring criteria first, which always takes precedence. Penalty points can only be deducted in a part of the question that has earned credit via the question rubric. No part of a question (a, b, c) may have a negative point total. A given penalty can be assessed only once for a question, even if it occurs multiple times or in multiple parts of that question. A maximum of 3 penalty points may be assessed per question.

1-Point Penalty
v) Array/collection access confusion ([] get)
w) Extraneous code that causes side-effect (e.g., printing to output, incorrect precondition check)
x) Local variables used but none declared
y) Destruction of persistent data (e.g., changing value referenced by parameter)
z) Void method or constructor that returns a value

No Penalty
• Extraneous code with no side-effect (e.g., valid precondition check, no-op)
• Spelling/case discrepancies where there is no ambiguity*
• Local variable not declared provided other variables are declared in some part
• private or public qualifier on a local variable
• Missing public qualifier on class or constructor header
• Keyword used as an identifier
• Common mathematical symbols used for operators (× • ÷ ≤ ≥ <> ≠)
• [] vs. () vs. <>
• = instead of == and vice versa
• length/size confusion for array, String, List, or ArrayList; with or without ( )
• Extraneous [] when referencing entire array
• [i,j] instead of [i][j]
• Extraneous size in array declaration, e.g., int[size] nums = new int[size];
• Missing ; where structure clearly conveys intent
• Missing {} where indentation clearly conveys intent
• Missing () on parameter-less method or constructor invocations
• Missing () around if or while conditions

*Spelling and case discrepancies for identifiers fall under the “No Penalty” category only if the correction can be unambiguously inferred from context, for example, “ArayList” instead of “ArrayList”. As a counterexample, note that if the code declares “int G=99, g=0;”, then uses “while (G < 10)” instead of “while (g < 10)”, the context does not allow for the reader to assume the use of the lower case variable.
Question 3: Array / ArrayList  

Canonical solution

(a) 
```java
public void addMembers(String[] names, int gradYear) 
{
    for (String n : names) 
    {
        MemberInfo newM = new MemberInfo(n, gradYear, true);
        memberList.add(newM);
    }
}
```

(b) 
```java
public ArrayList<MemberInfo> removeMembers(int year) 
{
    ArrayList<MemberInfo> removed = new ArrayList<MemberInfo>();

    for (int i = memberList.size() - 1; i >= 0; i--) 
    { 
        if (memberList.get(i).getGradYear() <= year) 
        { 
            if (memberList.get(i).inGoodStanding()) 
            { 
                removed.add(memberList.get(i));
            }
            memberList.remove(i);
        }
    }
    return removed;
}
```
(a) addMembers

Total for question 3 9 points
a) Public void addMembers(String[] names, int gradYear) 
  
  for (int j = 0; j < names.length; j++)
  
  Member Info x = new Member Info(names[j], gradYear, true);
  
  MemberList.add(x);
public ArrayList<MemberInfo> removeMembers(int year)
{
    ArrayList<MemberInfo> ret = new ArrayList<MemberInfo>(0);
    for (MemberInfo c : memberList)
    {
        if (c.getGradYear() <= year) & & c.inGradStanding() == true
        {
            ret.add(c);
            if (c.getGradYear() < year)
                memberList.remove(c);
        }
    }
    return ret;
}
Begin your response to each question at the top of a new page.

```java
public void addMembers(String[] names, int gradYear)
{
    for (int i = 0; i < names.length; i++)
    {
        String memberName = names[i] +
        MemberList.add (memberName, memberName, gradYear, true);
    }
}
```

Part A
Begin your response to each question at the top of a new page.

```java
public ArrayList<MemberInfo> RemoveMember(int Year)

    ArrayList Removed = new ArrayList();
    for (int i = 0; i < MemberList.size(); i++)
        if (MemberList.get(i).getGradYear() >= Year)
            if (MemberList.get(i).isGoodStanding() == true)
                Removed.add(MemberList.get(i));
                MemberList.remove(i);
            else
                MemberList.remove(i);
    return Removed;
```

**Part b**
Begin your response to each question at the top of a new page.

(a) public void addMembers(String[] names, int gradYear) {
    for (int i=0; i<names.length;i++)
    {
        memberList.add(new MemberInfo(names[i], gradYear, true));
    }
}

(b) public ArrayList<MemberInfo> removeMembers(int year) {
    ArrayList<MemberInfo> removed;
    for (int i=0; i<memberList.size();i++)
    {
        if (memberList.get(i).getGradYear() == year)
        {
            removed.add(memberList.get(i));
            memberList.remove(i);
        }
    }
    return removed;
}
Question 3

Overview

This question tested the student’s ability to:

- Write program code to create objects of a class and call methods.
- Write program code to satisfy methods using expressions, conditional statements, and iterative statements.
- Write program code to create, traverse, and manipulate elements in 1D array or ArrayList objects.

This question involved the manipulation of both a one-dimensional array containing String values and an ArrayList containing MemberInfo objects. Students were expected to write two methods in the enclosing ClubMembers class, making use of its ArrayList instance variable as well as two methods from the MemberInfo class.

In part (a) students were expected to write a loop to access each element of an array parameter. Inside the loop, students were expected to: (1) Construct a MemberInfo object using the new keyword and three parameters: a name from the array, gradYear, and true, in that order; (2) Add the constructed MemberInfo object to the ClubMembers instance variable memberList.

In part (b) students were asked to develop an algorithm to: (1) Identify club members who have graduated and are in good standing and add those club members to an ArrayList to be returned; (2) Remove from memberList those club members who have graduated, regardless of whether or not they are in good standing; and (3) Leave club members who have not yet graduated in memberList. Students had to create an ArrayList of MemberInfo objects to be returned and write a loop to access each element of the given ArrayList instance variable. Inside the loop, students had to call getGradYear and correctly compare the int return value to the year parameter. They also had to call inGoodStanding and use the boolean return value appropriately.

Sample: 3A
Score: 8

In part (a) point 1 was earned by accessing all elements of names with no bounds errors. The response uses a traditional for loop with correct lower and upper bounds. Within the context of the loop, the response accesses names[j]. Point 2 was earned by instantiating a MemberInfo object by using the keyword new and the correct parameters. Point 3 was earned by adding MemberInfo objects to memberList in the context of a loop. The response correctly calls the add method for memberList with the parameter of an instantiated MemberInfo object that has been assigned to a separate variable.

In part (b) point 4 was earned by correctly declaring and initializing an ArrayList of MemberInfo objects. Point 5 was not earned because the response calls the remove method within an enhanced for loop, which causes an exception to be thrown. Point 6 was earned because there are correct calls to both the getGradYear and inGoodStanding methods. Omitting the () on each method call falls into the "No Penalty" category. Point 7 was earned because the response distinguishes three cases, based on graduation status and standing. The three identified cases are: (1) members who have graduated in good standing; (2) members who have graduated but are not in good standing; and (3) members who have not yet graduated. Point 8 was earned by identifying graduating members. The response correctly identifies graduating members by checking if the graduation year returned by the method call is less than or equal to the method’s year parameter. Point 9 was earned because the response first correctly identifies graduating members in good standing and adds them to the ArrayList to be returned, then identifies graduating members and removes them from memberList. Members who have not yet graduated remain in memberList. Note that the
Question 3 (continued)

faint } at the end of the loop may have been erased, but because the indentation of the response clearly conveys intent, the possibly missing } is one of the minor errors for which no penalty is assessed. (See the "No Penalty" category on page 1 of the Scoring Guidelines for a complete list.)

Sample: 3B
Score: 5

In part (a) point 1 was earned by accessing names[i] in a traditional for loop with correct bounds. Point 2 was not earned because the response makes no attempt to instantiate a MemberInfo object using the keyword new and the correct parameters. Point 3 was not earned because the response does not add a MemberInfo object to memberList within a loop.

In part (b) point 4 was earned because the ArrayList is declared and initialized correctly. The response does not declare an object type for the ArrayList but it is not always required in a statement of this form; current versions of Java permit the angle-bracketed types to be omitted in certain circumstances when the type can be inferred. When writing a method that returns an ArrayList<MemberInfo>, all of the following ArrayList declarations and instantiations will work and receive credit:

```java
ArrayList<MemberInfo> list1 = new ArrayList<MemberInfo>();
ArrayList<MemberInfo> list2 = new ArrayList();
ArrayList list3 = new ArrayList<MemberInfo>();
ArrayList list4 = new ArrayList();
ArrayList<MemberInfo> list5 = new ArrayList<>();
ArrayList list6 = new ArrayList<>();
ArrayList ArrayList = new ArrayList();
```

Point 5 was not earned because the response does a forward traversal of the ArrayList with a call to the remove method and does not account for the shift left of elements. Point 6 was earned because the calls to the getGradYear and inGoodStanding methods are correct. Point 7 was earned because the response distinguishes three cases based on graduation status and standing. The response behaves differently in all three cases. Point 8 was not earned because the response incorrectly determines if the graduation year is greater than or equal to year. Point 9 was earned because, following the use of an incorrect operator, a subset of the graduates is removed from memberList and some of the removed members are added appropriately to the ArrayList to be returned, based on standing.

Sample: 3C
Score: 4

In part (a) point 1 was earned by accessing names[i] in a traditional for loop with correct bounds. Point 2 was earned by instantiating a MemberInfo object using the keyword new and the correct parameters. Point 3 was earned by adding MemberInfo objects to memberList within a loop.

In part (b) point 4 was not earned because even though the ArrayList is declared correctly, it is not initialized as an ArrayList of MemberInfo objects. Point 9 can still be earned because only a declaration is required for that point. Point 5 was not earned because the response does a forward traversal of the ArrayList with a call to the remove method and does not account for the shift left of elements. Point 6 was earned because there is a correct call to either the getGradYear or inGoodStanding methods. In this case, a call to getGradYear correctly occurs on a MemberInfo object. Point 7 was not earned because the response fails to access standing and because the response only distinguishes two cases. Point 8 was not
Question 3 (continued)

earned because the response incorrectly identifies graduating members by checking if the graduation year == year. Point 9 was not earned because the response does not distinguish the correct three cases based on graduation status and standing.
