The following assumptions are used in this exam.

I. The frame of reference of any problem is inertial unless otherwise stated.
II. The direction of current is the direction in which positive charges would drift.
III. The electric potential is zero at an infinite distance from an isolated point charge.
IV. All batteries and meters are ideal unless otherwise stated.
V. Edge effects for the electric field of a parallel plate capacitor are negligible unless otherwise stated.
### MECHANICS

- \( v_x = v_{x0} + a_x t \)
- \( x = x_0 + v_{x0} t + \frac{1}{2} a_x t^2 \)
- \( v_x^2 = v_{x0}^2 + 2a_x (x - x_0) \)
- \( \ddot{a} = \frac{\sum \ddot{F}}{m} = \frac{\ddot{F}_{\text{net}}}{m} \)
- \( \ddot{F} = \frac{d\ddot{p}}{dt} \)
- \( \ddot{J} = \int \ddot{F} \cdot d\ddot{r} = \Delta \ddot{p} \)
- \( \ddot{p} = m \ddot{v} \)
- \( |\ddot{F}_r| \leq \mu |\ddot{F}_n| \)
- \( \Delta E = W = \int \ddot{F} \cdot d\ddot{r} \)
- \( K = \frac{1}{2} mv^2 \)
- \( P = \frac{dE}{dt} \)
- \( P = \ddot{F} \cdot \ddot{v} \)
- \( \Delta U_g = mg\Delta h \)
- \( a_c = \frac{v^2}{r} = \omega^2 r \)
- \( \ddot{\bar{r}} = \ddot{r} \times \ddot{\bar{F}} \)
- \( \ddot{a} = \frac{\sum \ddot{r}}{I} = \frac{\ddot{r}_{\text{net}}}{I} \)
- \( I = \int r^2 dm = \sum mr^2 \)
- \( x_m = \sum \frac{m_i x_i}{\sum m_i} \)
- \( v = r \omega \)
- \( \ddot{L} = \ddot{r} \times \ddot{p} = I \ddot{\omega} \)
- \( K = \frac{1}{2} I \omega^2 \)
- \( \omega = \omega_0 + \alpha t \)
- \( \theta = \theta_0 + \omega_0 t + \frac{1}{2} \alpha t^2 \)

### ELECTRICITY AND MAGNETISM

- \( |\dddot{F}_E| = \frac{1}{4 \pi \varepsilon_0} \left| \frac{q_1 q_2}{r^2} \right| \)
- \( E = \frac{\dddot{F}_E}{q} \)
- \( \oint \dddot{E} \cdot d\dddot{A} = \frac{Q}{\varepsilon_0} \)
- \( E_x = -\frac{dV}{dx} \)
- \( \Delta V = -\int \dddot{E} \cdot d\dddot{r} \)
- \( V = \frac{1}{4 \pi \varepsilon_0} \sum_i \frac{q_i}{r_i} \)
- \( U_E = qV = \frac{1}{4 \pi \varepsilon_0} \frac{q_1 q_2}{r} \)
- \( I = \frac{dQ}{dt} \)
- \( U_C = \frac{1}{2} Q \Delta V = \frac{1}{2} C (\Delta V)^2 \)
- \( d\dddot{B} = \frac{\mu_0}{4 \pi} \frac{I d\dddot{r} \times \hat{r}}{r^2} \)
- \( R = \frac{\rho l}{A} \)
- \( \dddot{B} = \rho \dddot{J} \)
- \( I = Ne \nu_d A \)
- \( \dddot{E} = \rho \dddot{J} \)
- \( \Phi_B = \int \dddot{B} \cdot d\dddot{A} \)
- \( I = \frac{\Delta V}{R} \)
- \( \dddot{E} = \frac{\Delta V}{R} \)
- \( \dddot{E} = -\frac{d\Phi_B}{dt} \)
- \( \dddot{E} = -L \frac{dI}{dt} \)
- \( U_L = \frac{1}{2} LI^2 \)
- \( P = 1 \Delta V \)
GEOMETRY AND TRIGONOMETRY

Rectangle
\( A = bh \)

Triangle
\( A = \frac{1}{2}bh \)

Circle
\( A = \pi r^2 \)
\( C = 2\pi r \)
\( s = r\theta \)

Rectangular Solid
\( V = \ell wh \)

Cylinder
\( V = \pi r^2 \ell \)
\( S = 2\pi r \ell + 2\pi r^2 \)

Sphere
\( V = \frac{4}{3}\pi r^3 \)
\( S = 4\pi r^2 \)

Right Triangle
\( a^2 + b^2 = c^2 \)
\( \sin \theta = \frac{a}{c} \)
\( \cos \theta = \frac{b}{c} \)
\( \tan \theta = \frac{a}{b} \)

CALCULUS
\[ \frac{df}{dx} = \frac{df}{du} \frac{du}{dx} \]
\[ \frac{d}{dx} (x^n) = nx^{n-1} \]
\[ \frac{d}{dx} (e^{ax}) = ae^{ax} \]
\[ \frac{d}{dx} (\ln ax) = \frac{1}{x} \]
\[ \frac{d}{dx} \left[ \sin (ax) \right] = a \cos (ax) \]
\[ \frac{d}{dx} \left[ \cos (ax) \right] = -a \sin (ax) \]
\[ \int x^n dx = \frac{1}{n+1} x^{n+1}, \quad n \neq -1 \]
\[ \int e^{ax} dx = \frac{1}{a} e^{ax} \]
\[ \int \frac{dx}{x + a} = \ln |x + a| \]
\[ \int \cos (ax) dx = \frac{1}{a} \sin (ax) \]
\[ \int \sin (ax) dx = -\frac{1}{a} \cos (ax) \]

VECTOR PRODUCTS
\( \vec{A} \cdot \vec{B} = AB \cos \theta \)
\( |\vec{A} \times \vec{B}| = AB \sin \theta \)
PHYSICS C: MECHANICS
SECTION II
Time—45 minutes
3 Questions

Directions: Answer all three questions. The suggested time is about 15 minutes for answering each of the questions, which are worth 15 points each. The parts within a question may not have equal weight. Show all your work in this booklet in the spaces provided after each part.

1. A 0.50 kg fan cart is placed on a level, horizontal track of negligible friction, as shown. The fan is turned on, and the fan cart is released from rest and moves to the right. The cart travels along the horizontal track and then down an incline. Motion detector 1 measures the acceleration $a$ of the cart from time $t = 0$ to $t = 3$ s. At $t = 3$ s, the cart makes a smooth transition to the incline, and motion detector 2 measures the acceleration of the cart after $t = 3$ s. The fan exerts the same magnitude of force on the cart during the entire motion. The graphs below show $a$ as functions of $t$. For each motion detector, the positive direction is away from the detector.

MOTION DETECTOR 1
\[ a_1 \text{ (m/s}^2) \]
\[ \begin{array}{cccc}
+2 & 0 & -2 \\
0 & 1 & 2 & 3 \\
\hline
\end{array} \]

MOTION DETECTOR 2
\[ a_2 \text{ (m/s}^2) \]
\[ \begin{array}{cccc}
+2 & 0 & -2 \\
3 & 4 & 5 \\
\hline
\end{array} \]

Use a pencil or pen with black or dark blue ink only. Do NOT write your name. Do NOT write outside the box.
Continue your response to QUESTION 1 on this page.

(a) On the dots below that represent the cart at two different locations, draw and label the forces (not components) that act on the cart at each location. Each force must be represented by a distinct arrow starting on, and pointing away from, the dot.

(b) Calculate the magnitude of the net force exerted on the fan cart when it is on the horizontal track.

(c) Calculate the angle \( \theta \) of the incline.

(d) Suppose careful measurement determines the angle of the incline to be 3° larger than that calculated in part (c). Consider the following explanation.

“The scale used to measure the mass of the fan cart was not calibrated properly before the measurement, and this could account for the observed difference in the angle.”

Does the explanation sufficiently account for the observed discrepancy?

_____ Yes  _____ No

Justify your answer.
The experiment is repeated for several trials, each with a different angle for the incline. The acceleration of the cart down the incline is measured for each angle. The graph below shows the plot of the acceleration $a$ of the cart as a function of the sine of the angle $\sin \theta$.

(e)

i. Draw a best-fit line for the data.

ii. Using the straight line, calculate an experimental value for the acceleration due to gravity $g$.

(f) If the cart were replaced with a second cart of mass 1.0 kg that has a fan that exerts the same magnitude of force as the original fan, explain how the graph given in part (e) would change.
2. A block of mass \( m \) starts from rest at point A and travels with negligible friction through the loop onto a horizontal surface, where the block makes contact with a spring of spring constant \( k = \frac{mg}{2R} \). All motion of the spring is in the horizontal direction. Point C is the highest point on the loop, and point B is the rightmost point on the loop. Express all algebraic answers in terms of \( m \), \( h \), \( R \), and physical constants, as appropriate.

(a) On the dot below, which represents the block, draw an arrow that represents the direction of the acceleration of the block at point B in the figure above. The arrow must start on and point away from the dot.

[Diagram of a block with an arrow indicating acceleration]

Justify your answer.

(b)

i. Derive an expression for the speed \( v \) of the block at point B.

ii. Derive an expression for the magnitude of the net force \( F \) on the block at point B.
(c) In terms of $R$, derive an expression for the minimum height $h_{\text{min}}$ necessary for the block to maintain contact with the track through point $C$.

(d) It is determined that $h = 0.30 \text{ m}$ and $R = 0.10 \text{ m}$. If the block is released from a height greater than that found in part (c), what would be the maximum compression $x_{\text{MAX}}$ of the spring?

(e) A graph of the maximum compression of the spring as a function of height is shown below. The height $h_{\text{min}}$ is the height calculated in part (c).

   ![Graph of the maximum compression of the spring as a function of height]

   i. Explain why section I appears as a horizontal line segment on the horizontal axis.

   ii. Explain the reason for the shape of section II on the graph.
3. A triangular rod of length $L$ and mass $M$ has a nonuniform linear mass density given by the equation $\lambda = \gamma x^2$, where $\gamma = \frac{3M}{L^3}$ and $x$ is the distance from point $P$ at the left end of the rod.

(a) Using integral calculus, show that the rotational inertia $I$ of the rod about an axis perpendicular to the page and through point $P$ is $\frac{3}{5}ML^2$.

(b) Determine the horizontal location of the center of mass of the rod relative to point $P$. Express your answer in terms of $L$.

(c) For an axis perpendicular to the page, is the value of the rotational inertia of the rod around point $P$ greater than, less than, or equal to the value of the rotational inertia of the rod around the rod’s center of mass?

  _____ Greater than  _____ Less than  _____ Equal to

Justify your answer.
The rod is released from rest in the position shown, and the rod begins to rotate about a horizontal axis perpendicular to the page and through point P.

(d) On the axes below, sketch graphs of the magnitude of the net torque $\tau$ on the rod and the angular speed $\omega$ of the rod as functions of time $t$ from the time the rod is released until the time its center of mass reaches its lowest point.

(e) As the rod rotates from the horizontal position down through vertical, is the magnitude of the angular acceleration on the rod increasing, decreasing, or not changing?

_____ Increasing     _____ Decreasing     _____ Not changing

Justify your answer.
(f) The mass of the rod is 3.0 kg, and the length of the rod is 1.0 m. Calculate the linear speed $v$ of point S as the rod swings through the vertical position shown.
STOP

END OF EXAM
